

AI MOVIE TOOLS

SUMMARY REPORT

YELLOW RAV3N PRODUCTION STACK
TOOL COMPARISON // PRICING // FIT AGAINST OUR REQUIREMENTS

CONTENT RATING

Yellow Rav3n's original vibe is Rated-R, for mature viewing: gore, blood, intense violence and other sensitive content. A tool's handling of mature content is a hard production requirement for this project, not a preference.
Current rendering: ~PG-13 — a tools-policy ceiling, not intent.

FILED 2026-10-21 // AI MOVIE TOOLS — RAV3N STACK

~C4CHAOS / FLUFFY

Filed 2026-10-21, □ AI Movie Tools — Rav3n Stack, at the user's order. PDF EDITION — prepared for sharing outside the production workspace.

Content rating note: Yellow Rav3n's original vibe is Rated-R — for mature viewing — due to gore, blood, intense violence and other sensitive content. A tool's handling of mature, sensitive content is therefore a hard production requirement for this project, not a preference. Note: as currently rendered with today's frontier AI tools, the work sits at roughly PG-13 — a ceiling imposed by those tools' content policies and limitations, not by the project's intent. Scope: the tools covered in this chat's first session (ScreenWeaver in depth; LTX Studio, Katalist, M Studio, Higgsfield, Imaginode, Runway and Dreamina/CapCut for comparison), scored against our requirements and our current workflow. Prices as published/checked Oct 2026; vendor claims marked (claim). Detail sources: screenweaver-analysis-2026-10-21.md, video-tools-reference.md.

// 1. OUR REQUIREMENTS (THE SPEC EVERY TOOL IS SCORED AGAINST)

- **R1 — Shoe-string budget.** Sunk subscriptions and free tiers preferred; fast-burning credit pools and pricey tiers score down.
- **R2 — iPhone-only (iPad at most).** No desktop or laptop exists in this production. Every step must work on the phone, anywhere, anytime, when inspiration strikes.
- **R3 — Continuity as canon law.** Not just "same character": the Continuity Five (looks, hair, kimono, sword, setting), face stack in every call, locks (character / house style / negative / sword), rule-level holds (eye-state rules for sensitive sequences; Wingspan placement; empty-saya state), and audit.
- **R4 — A policy lane for mature content.** The project's Rated-R material (gore, blood, intense violence, sensitive content) must be producible somewhere without silent watering-down (today: the Grok lane).
- **R5 — Post on the phone.** Editing/soundtrack work finishes in CapCut on iPhone; any tool must hand off cleanly to that, not demand a desktop NLE.
- **R6 — Ours stays ours.** Canon, scripts, masters and workflow live in our own files; the Centaur (user + Fluffy) directs, agents execute, no vendor becomes the single point of failure or the only copy-holder.
- **R7 — Hybrid-ready.** Under the Hybrid Doctrine, external tools are a Stage 2 bench: they receive frozen briefs under the YR Handoff Protocol (minimum disclosure) and execute; they do not own development.
- **R8 — Proof standard.** The bar is shipped work: a consistent photoreal character across a one-minute teaser, produced on a phone (the launch teaser, live).

// 2. THE TOOLS — CAPABILITIES & PRICING

Pipeline tools (script → storyboard → shots)

Tool	Core capability	Continuity system	Generation	Agent hook	Pricing (Oct 2026)
ScreenWeaver	Screenplay editor (beats/outline in sync, FDX/Fountain/PDF import, PDF/FDX/JSON export) → auto shot breakdown + script-linked storyboard → editable node production workflows	Characters/sets defined once, carried across shots	Third-party models via its pipelines (BytePlus/Seedance route; Higgsfield nodes, founder claim)	**MCP server**: Claude/ChatGPT/Cursor work inside the project	Free writing tier (no boards); Auteur $39.99/mo, 6,000 credits; Studio $149.99/mo, 25,000 credits. Credit burn unpublished

Tool	Core capability	Continuity system	Generation	Agent hook	Pricing (Oct 2026)
LTX Studio (Lightricks)	Idea/script → scenes → shots → storyboard → in-app timeline edit + pitch decks	Elements: characters/objects defined once, tagged across scenes	Own LTX models; Kling/Seedance from Standard; Veo on Pro	API	Free (personal use only); Lite $15; Standard $35 (commercial rights start here, AI storyboards here); Pro $125
Katalist	Script → storyboard fast (minutes, claim), animatics, Premiere Pro timeline export	Custom characters, recasting	Bundled video/lip-sync models	—	Essential $19/mo; Pro $39/mo; Unlimited $99/mo; 7-day trial
M Studio	Brief/screenplay PDF → planned scenes, shot list, cast, per-shot prompts; voice/music/SFX + timeline in one app	One reference image per character, auto-attached	Single video model (MiniMax H3)	—	From $27/mo starter; $1 trial (claim)

Aggregators & generators

Tool	Core capability	Continuity system	Generation	Agent hook	Pricing (Oct 2026)
Higgsfield	Multi-model production suite: Cinema Studio (camera/lens/director controls), Marketing Studio, Lipsync Studio, Popcorn boards (up to 8 frames)	**Soul ID**: identity trained on your photos, reused across models	35+ models (Seedance 2.5, Kling 3.0, Veo 3.1, Wan, more)	MCP + CLI; Adobe plugin	~$15–19 Starter (200–270 credits); ~$49–59 Plus (1,000–1,200; Seedance 2.5 starts here); $129 Ultra (3,000). Credits don't roll over. NOTE: its own pages quote differing tiers — verify at checkout
Imaginode (ScreenWeaver's sibling)	Node canvas for image/video/voice/music across 100+ models; **3D previz studio** (build a rough 3D set, place camera/lens/moves, export start/end frames)	Reference tags repeated per shot (manual discipline)	100+ models (Seedance, Kling, Veo, Flux, etc.)	—	Credit-based, ~1¢/credit, shot builds ~5–12 credits
Runway	Generator + editor: Gen-4.5, video-to-video editing (Aleph), performance transfer (Act-Two), native audio tools	Gen-4 References	Own models + hosted (Seedance/Kling/Veo listed)	—	Standard $15/mo; Pro $35; Max $95
Dreamina / CapCut	Seedance-native generator; CapCut is ALSO our post house (editor, soundtrack cutting)	Reference-based	Seedance	—	Already in stack. Generator lane censors mature, sensitive content (dead lane for the R-rated material, logged); editor remains essential

Already on record (from video-tools-reference.md, pre-dating this chat)

- **fal.ai / Replicate** — hosted open-model video (Wan 2.2 etc.), roughly $0.01–0.20/clip, no GPU management; the standing middle lane for sensitive-content cuts.
- **ComfyUI + Wan 2.2 on rented GPU** (RunPod/Vast) — zero-filter self-hosted route; our Stage 2 heavy option for canon a landlord won't touch. (User has no GPU and no desktop: rented/hosted only, phone-controlled.)
- **Grok / Gemini lanes** — current generation homes (see §4).

// 3. SCORED AGAINST OUR REQUIREMENTS

PASS pass · PART partial · FAIL fail / unverified

Tool	R1 Budget	R2 iPhone	R3 Canon law	R4 Policy lane	R5 Phone post	R6 Ours stays ours
Our current workflow	PASS	PASS	PASS	PASS (Grok lane)	PASS (CapCut)	PASS

Tool	R1 Budget	R2 iPhone	R3 Canon law	R4 Policy lane	R5 Phone post	R6 Ours stays ours
ScreenWeaver	PART free writing; pipeline $39.99 + opaque credits	FAIL web app, phone UX unverified	PART identity carry-over; no rule-level holds proven, anime-scale proof only	FAIL hosted moderation assumed; no route around	PART exports shots; finish elsewhere	PART scripts export cleanly; boards/workflows stay inside
LTX Studio	PART commercial from $35	FAIL timeline/desktop-shaped	PART Elements identity; clothing drift reported	FAIL	FAIL in-app timeline replaces phone post	PART bigger company, exports exist
Katalist	PASS $19 entry	FAIL Premiere-shaped export	PART character consistency praised; polish manual	FAIL	FAIL Premiere FCP export is desktop	PART
M Studio	PART $27	FAIL unverified	FAIL one ref per character, one video model	FAIL	PART timeline in-app (desktop-shaped)	FAIL newest, least proven
Higgsfield	FAIL credits burn fast, no rollover, best models gated to Plus+	PASS mobile app / mobile-first	PART Soul ID is real identity tech; consistency still takes multiple takes (reviews)	FAIL hosted models' rules apply	PART generation suite, finish elsewhere	PART MCP/CLI open; identity lives on their platform
Imaginode	PASS cheap credits, pay per shot	PASS built for mobile browser (claim)	FAIL manual reference discipline = our job anyway	PART routes many models; each model's rules apply	PART exports frames/clips	PART node projects inside platform
Runway	PART $15 entry, premium models pricey	FAIL	PART References, no canon-law	FAIL	FAIL editor is desktop-shaped	PART
Dreamina (generator)	PASS in stack	PASS app	PART	FAIL censors mature content (dead lane)	n/a	PART
fal.ai / Replicate	PASS per-clip cents	PART web playgrounds, phone-usable	FAIL raw models; law is our prompts	PART open models, light platform filter	PART clips out to CapCut	PASS API, our files, no lock-in
ComfyUI + Wan (rented)	PART rental hours, cheap at our volume	PART phone controls a remote box; setup is the friction	PART LoRA route could harden identity (untested)	PASS zero filter on our weights	PART clips out to CapCut	PASS our weights, our rules

// 4. OUR CURRENT WORKFLOW (THE CHAMPION, FOR COMPARISON)

- **Direction & canon:** user (director) + Fluffy (agent/co-author) — the Centaur. Canon, story arc, Prompt Library and production boards live in our own workspace files (Context Node as single entry point).
- **Planning/storyboard:** Prompt Library assembly (Character Lock + House Style Lock + entry + ONE camera move + Negative Lock), production boards in markdown, storyboard contact sheets; trial and error in Fluffy's lane (cheap) so paid lanes receive locked prompts only.
- **Continuity enforcement:** face stack (identity anchor + tattooed and clean close-ups) attached in EVERY still and video call; Continuity Five checked per frame in order (looks, hair, kimono, sword, setting); zoom-crop sword audits; verdicts logged back into the library.
- **Generation lanes:** Fluffy (main, canon-held seeds + previz) → Gemini (volume, full cinematic prompts) → Grok (the sensitive-content lane: mature material the other lanes decline). Lane routing IS the policy strategy.
- **Post:** CapCut on iPhone — assembly, soundtrack-locked cutting, SFX, voices. Soundtracks ledgered in-house; music routes via Suno for originals.

- **Cost shape:** sunk subscriptions only (Muse Power; Grok/Gemini usage pools; CapCut). No per-tool pipeline subscription, no credit pool burning by the shot beyond the pools already paid for.
- **Proof:** the launch teaser — one-minute photoreal teaser, consistent character across segments and lanes, assembled on an iPhone in an afternoon, launched 2026-10-21. No tool in §2 has published proof at that combination of photoreal + rule-level continuity + phone-only production.
- **Known weaknesses (honest):** bookkeeping is manual (markdown boards do not scale gracefully to a full season); reference attachment is hand-done every call (the labour pipeline tools automate); script handling is markdown, not a screenplay editor; everything depends on the user's taste + Fluffy's audits — which is also the design (the bottleneck is a feature).

// 5. VERDICTS

- **CHAMPION (Stage 1, permanent): our current workflow.** Only entry that passes R1–R6 today, and the only one with R8 proof at our difficulty.
- **STAGE 2 BENCH, in order:** 1. **LTX Studio** — most mature pipeline, commercial-licence clarity, timeline; first call when a funded finish needs a managed pipeline. 2. **ScreenWeaver** — the MCP wildcard: if an agent can work inside the project, it fits the Centaur pattern like nothing else in the field; free writing tier makes parking future episode scripts costless now. Warm peer contact with the founder's project already established. 3. **Katalist** — budget board machine ($19) if a Stage 2 job needs fast client-ready boards without a full pipeline commitment. 4. **ComfyUI + Wan on rented GPU / fal.ai** — the policy-free heavy lane for canon the landlords won't touch.
- **WATCH:** Higgsfield (Soul ID is the one continuity tech worth a future scored test; credit economics fail R1 today) · Imaginode (3D previz is genuinely different; mobile-first) · M Studio (too new, one-model ceiling).
- **PASS for production use:** Runway (excellent generator/editor, solves no problem we have) · Dreamina as a generator for the R-rated material (dead lane; CapCut the editor stays).

// 6. BOTTOM LINE

The field sells three things: generation (a commodity we already rent by the lane), bookkeeping (real, and our one genuine gap at season scale), and identity automation (improving, unproven at canon-law level). None sells what our workflow is made of: canon law, lane-routed policy freedom, and a director-agent pair that works from a phone at shoe-string cost. Until a script-shaped, funded Stage 2 job exists, the correct spend is $0: park scripts free where useful, keep the bench warm, and let the industrial tools compete for our brief when we have one worth shipping — under the YR Handoff Protocol when they get it.
